

Force liquefies the competition: Force CS versus Capture LFR

Does your soil-applied insecticide consistently provide the best corn rootworm (CRW) protection?

Insecticide	Best protection under high CRW pressure*
Force® brands	Yes ✓
Capture® LFR®	No ✗

**In 15 of 15 head-to-head trials from the Northern Illinois Ag Resource Center in DeKalb, Ill., Force root protection outperformed Capture LFR.*

Like Force CS, Capture LFR can be applied with in-furrow liquid fertilizer. But tests show that Force CS controls the most damaging corn insects more effectively, making it a better agronomic fit. University of Illinois field trials¹ show that under moderate to severe CRW pressure, areas treated with Capture LFR averaged one half of a node more damage than those treated with Force CS.

Why would you use a product that doesn't provide the most effective control?

Compare the lodged stalk and root damage of the corn treated with Capture LFR (center) and untreated check (left) versus the straight stalk and healthy roots of corn treated with Force (right).

Proven, consistent control

With Force CS soil-applied insecticide, growers can achieve the same top-rated performance they expect from Force 3G, but in an easy-to-use liquid formulation. Regardless of hybrid or application method (T-band or in-furrow), Force CS offers superior protection against early-season insects like corn rootworm for stronger root systems, better water and nutrient uptake and more efficient harvesting.

Reliable corn rootworm protection

Field trials conducted by the University of Illinois¹ have shown Force CS helps farmers grow more corn by consistently outperforming competitive insecticides such as Capture LFR for corn rootworm management.

Force Protects Roots: Average Root Ratings for Treated Roots

Roots treated with Force averaged a 0.19 rating, compared to the 1.57 rating of those treated with Capture LFR. Stronger roots mean higher yields. With over 25 years of proven corn insect control, **Force won't let your yield escape.**
