Delivering exceptional control of difficult to manage pests in onions
Minecto Pro offers exceptional control of the toughest pests in onions

A broad-spectrum, foliar insecticide, Minecto® Pro controls the most important onion pests including leafminers and thrips. Harnessing the power of two complementary active ingredients, cyantraniliprole and abamectin, into one convenient premix formulation, Minecto Pro protects against the toughest onion pests.

Features and benefits
- Controls the most problematic pests in onions including thrips and leafminers
- Contains the active ingredient cyantraniliprole, a second generation diamide that provides a broader spectrum of control than first generation diamides
- Provides two complementary modes of action (cyantraniliprole and abamectin), that are both active on thrips and leafminers
- Allows for robust use rates of each active ingredient

Best use guidelines
1. Minecto Pro must always be mixed with a non-phytotoxic, non-ionic activator type wetting, spreading and/or penetrating spray adjuvant or horticultural oil (not a dormant oil).
2. When pest populations are high, use the highest rate allowed for that pest.
3. For best control of thrips, use 10.0 fl oz/A.
4. Thorough coverage is essential to obtain best results. Select a spray volume appropriate for the size of the crop and density of foliage.
5. Apply this product diluted in a minimum volume of 20.0 gal/A by ground application or 5.0 gal/A by air. Under conditions such as high pest populations, dense foliage, or adverse application conditions (such as high temperatures), use a greater volume of water to ensure adequate coverage.
6. For best control apply Minecto Pro with ground application equipment. With aerial application, the resulting level and duration of control could be less than with ground application.
7. Do not make more than 2 sequential applications.

Insects controlled

* Liriomyza leafminers
* Thrips (foliage feeding only)
**Mode of action**
Calcium is released, muscle contracts

Cyantraniliprole is a ryanodine receptor modulator. It binds to the insect’s ryanodine receptor in muscle cells and causes the channel to open. This results in a flow of calcium ions from internal stores to the cytoplasm causing muscle paralysis, cessation of feeding and ultimately insect death.

---

**Chemistry**
Cyantraniliprole – IRAC Group 28
Abamectin – IRAC Group 6

**Mode of action**
Cyantraniliprole – 2nd generation diamide with a novel mode of action on insect ryanodine receptors
Abamectin – A mectin with a unique agonist mode of action on the neurotransmitter gamma-aminobutyric acid (GABA)

**Formulation**
Formulated as a suspension concentrate (SC) and contains 1.13 lb cyantraniliprole and 0.24 lb abamectin per gallon

**Systemicity**
Translaminar movement

**Precautions**
Signal word: Warning

**Re-entry interval (REI)**
12 hours

Onion thrips control (adults & nymphs)

- **Agri-Mek SC**: 3.4 oz/A
- **Minecto Pro**: 10.0 oz/A
- **Radiant**: 8.0 oz f/b
- **Movento**: 5.0 oz/A

No. of total thrips/6 plants in check:
- 3 DAA2: 12.8
- 6 DAA2: 8.7
- 11 DAA2: 5.7

Variety: Yellow Onion

All treatments included an organosilicone adjuvant @ 0.1% v/v
